

Problem

We need a program that fulfills the function of all administrative paperwork in the field of buying / selling, generating inventory invoicing and a warehouse for the registration of all items in the sales facilities, with the aim of having a digital system. For this, a database will be created containing a warehouse, administrative and labor personnel in which invoices, inventories, and employee records can be delivered.

To have a better understanding of what the program is going to do, you should do an analysis on the tools used by the store in terms of sales.

Overview

In the administrative field, the big bosses can base their buying / selling decisions on market analysis opinions. The bosses always make the decisions for the benefit of the company in our case of the premises when a boss tends to need to rethink the analysis of the resolution of the problem for the benefit of the entire company.

The solution proposed by our group will help the company avoid problems in the administration of sales and inventory, therefore, the company will avoid unnecessary expenses in the future.

Actually the company generates about 10000 dollars per month so it's a company able to spend time and resources in the creation of this software that with the time going to generate an important revenue recovery.

Background

The importance of updating is a crucial issue in the future of a company because it goes from an old paperwork system to an innovation in this digital case for the benefit of how the company will be managed taking into account that technology constantly changes entrepreneurs They will always look for the best benefit.

It was intended to create a flexible system to changes that are currently very moved and unpredictable also changes or updates should be very present for the future

Table 1(Sales):

ITEMS:	QUANTITY(per month):
Video games of PS4,PS3, switch.	60-70
Consoles	2-3
Accessories	20-30
Others (small products)	100-120
